

PredictEX Reward Challenges — Operator Guide

Daily routine for paying the welcome-bonus rewards, plus an overview of what users see. Version 1 · 25 Aug 2026

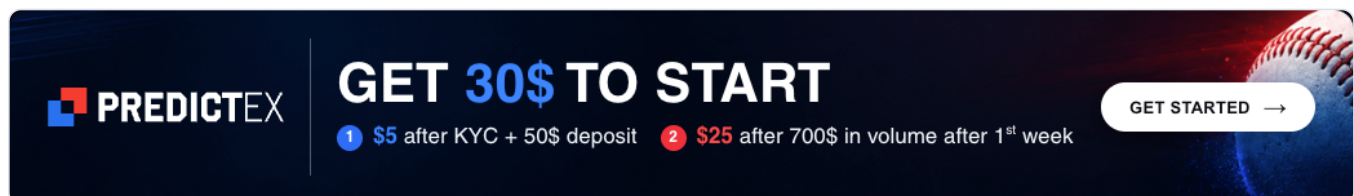

Claims sheet	https://docs.google.com/spreadsheets/d/1qK1OAPsJNgWPWiZbm9gEheBCTU7jkhSnr6BrWaSTbZk/edit?gid=0#gid=0 Every "Claim reward" click adds a row here.
Payouts file (edit)	https://github.com/SportsLine-Technologies/predictex-rewards/edit/main/payouts.json Add an address here after paying — this is what turns the user's card green.
Repo & format docs	https://github.com/SportsLine-Technologies/predictex-rewards
Basescan (tx lookup)	https://basescan.org

1. The two challenges

Challenge	Reward	User must...	Who is eligible
Verify & deposit kyc-deposit	\$5 USDC	Complete Level 1 verification and have at least \$50 in the betting account	New users only — accounts created on/after 24 Aug 2026
Trading volume volume-700	\$25 USDC	Reach \$700 of volume within any 7-day window (volume = contracts × the price shown in Trade History)	All wallets

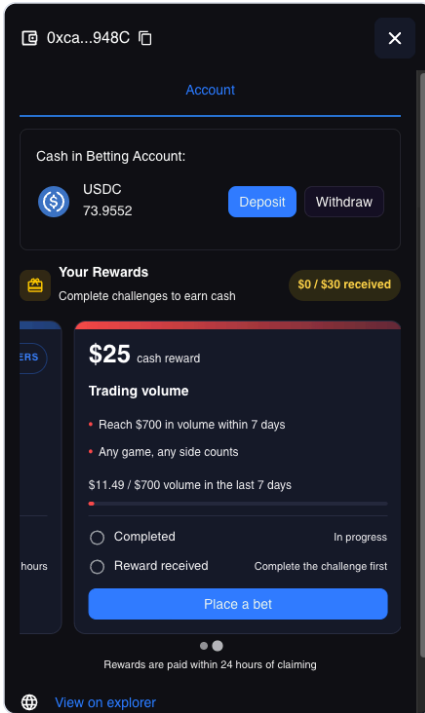

Rewards are paid manually in **USDC on Base** to the user's wallet address. The app promises payment **within 24 hours of claiming**.

2. What the user sees

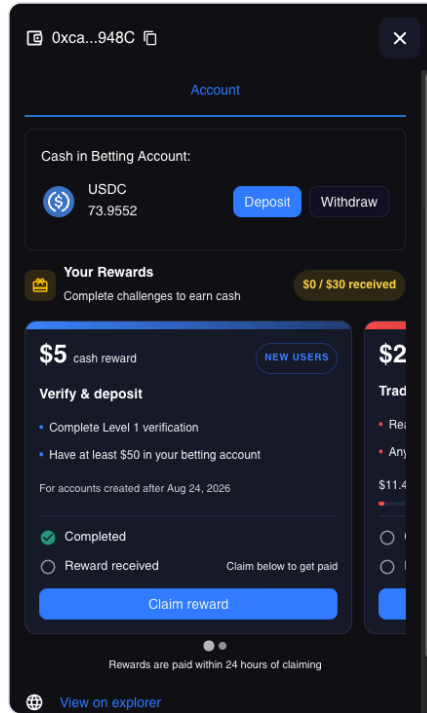

The home-page banner advertises the challenges. "Get started" opens sign-up / deposit.

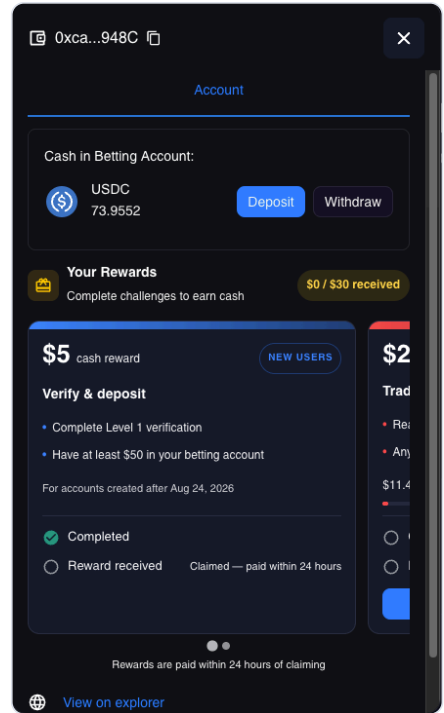

Users open the **Account** button (top right) — the "Your Rewards" section shows one swipeable card per challenge. The cards move through these states:

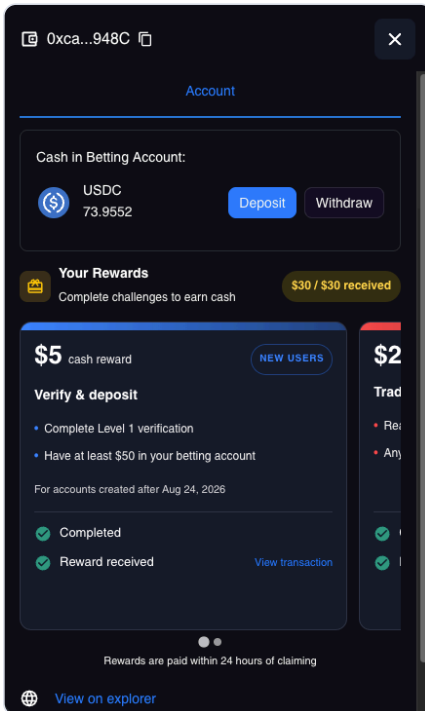

1 · **In progress** — live progress and a call to action ("Place a bet", "Deposit", "Verify now").

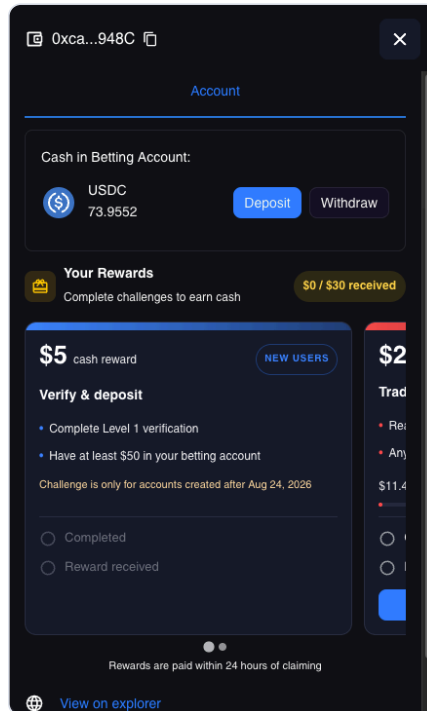

2 · **Completed** — "Completed" turns green and a **Claim reward** button appears. Clicking it adds a row to the claims sheet.

3 · **Claimed** — "Claimed — paid within 24 hours". The user now waits for you.

4 · **Paid** — after you add the address to `payouts.json`: "Reward received ✓" with a "View transaction" link; the chip shows \$30 / \$30.

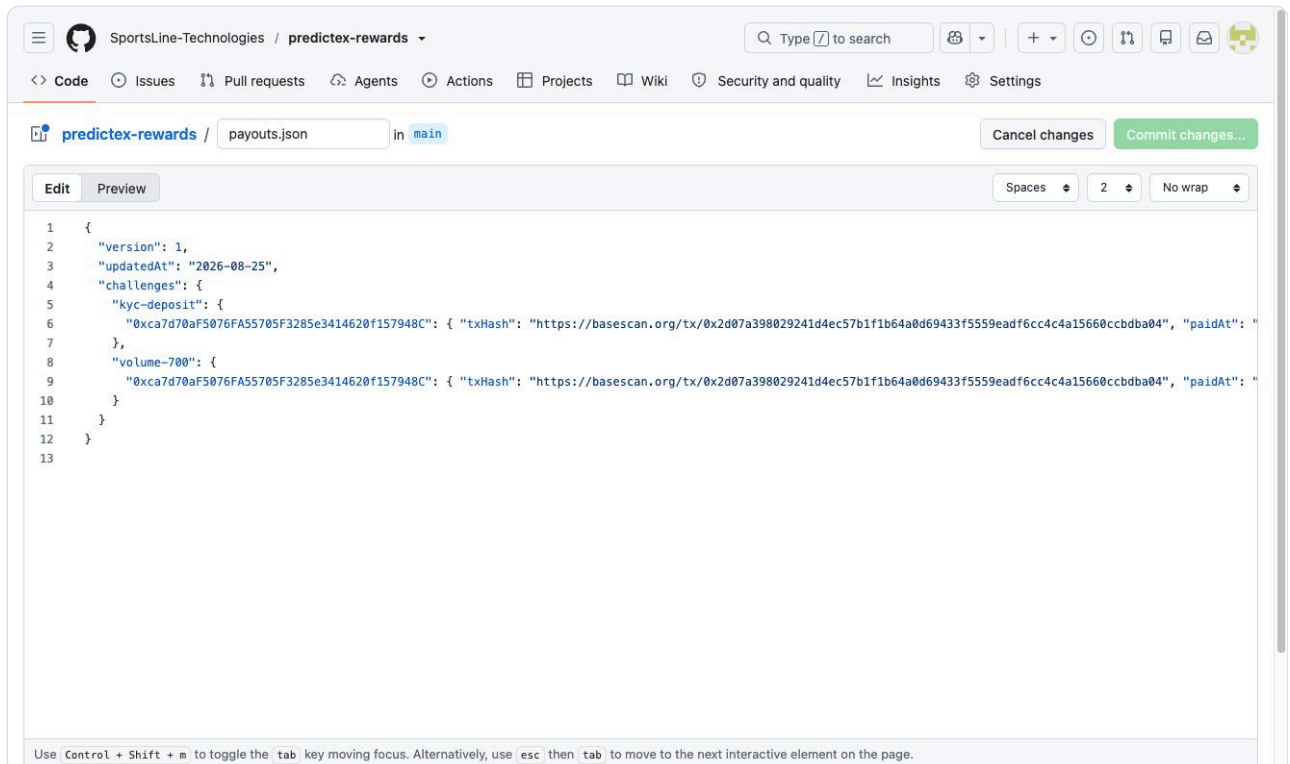

Not eligible — accounts created before 24 Aug 2026 see the \$5 card greyed out with a note. The \$25 card is open to everyone.

3. Daily routine (do this once a day)

- 1 **Open the claims sheet** — <https://docs.google.com/spreadsheets/d/1qK1OAPsJNgWPWiZbm9gEheBCTU7jkhSnr6BrWaSTbZk/edit?gid=0#gid=0>
Each row is one claim: Received At | Address | Challenge | Claimed At . Work through the rows that are not yet marked as paid (add a column **E "Paid"** and put the date there when done).
- 2 **Verify the claim** before paying (takes ~1 minute per row):
 - **Challenge kyc-deposit (\$5)**: account created on/after 24 Aug 2026 (check in the Privy dashboard → Users → the wallet's "Created" date); Level 1 verification completed (KYC backend / Verification tab); balance ≥ \$50 at the time of the claim (Basescan → the address → USDC balance, or the app).
 - **Challenge volume-700 (\$25)**: the wallet's Trade History shows ≥ \$700 of volume inside a 7-day window (sum of *contracts* × *displayed price* per trade).
 - Not sure? Skip the row, leave a note in column F, and ask in the team channel. Don't pay twice for the same address + challenge.
- 3 **Pay** — send **\$5** (kyc-deposit) or **\$25** (volume-700) in **USDC on Base** from the treasury wallet to the address in column B. Copy the transaction hash / Basescan link.
- 4 **Record the payout in GitHub** — open [payouts.json \(edit\)](#) and add one line under the matching challenge:

```
"0xca7d70aF5076FA55705F3285e3414620f157948C": { "txHash": "https://basescan.org/tx/0x...", "paidAt": "2026-08-26" }
```

The GitHub editor for payouts.json — add the line, then "Commit changes..." (top right).

Rules: paste the address as copied (any casing); separate entries with commas — **no comma after the last entry** in a block; txHash can be the bare hash or the full Basescan link; update `updatedAt` at the top. Then click **Commit changes...** → **Commit directly to the main branch** → Commit.

- 5 **Check the green tick** — on the repo page, the commit gets a ✓ within a minute if the file is valid. A ✗ means a typo (usually a missing/extra comma or quote): open the file again, fix, commit again. The app ignores an invalid file, so nobody goes green until it's fixed.
- 6 **Mark the sheet row as paid** (date in column E). Done — the user's card turns green automatically within ~5–10 minutes (the file is cached for 5 minutes; the app re-reads it when the account modal opens).

[illegible][illegible]

4. Troubleshooting

Situation	What to do
User says "I was paid but my card is still not green"	Check the address is in <code>payouts.json</code> under the right challenge , the commit has a green ✓, and 10 minutes have passed. Ask them to reload the page and reopen Account.
Commit shows a red ✗	The file is invalid. Common causes: comma after the last entry, missing quote, wrong challenge name (only <code>kyc-deposit</code> and <code>volume-700</code> exist), address not 42 characters. Fix and commit again.
Same address claims twice	The sheet ignores duplicate address + challenge pairs, so you'll only ever see one row per reward. Never pay twice.
Claim looks fraudulent (deposit → claim → withdraw)	The \$50 check is a snapshot of the balance. Verify on Basescan before paying; skip and flag if the balance left within hours of the claim.
"I can't edit the file on GitHub"	Only the 8 allow-listed org members can commit to <code>main</code> . Ask an admin to add you to the branch-protection push list (repo → Settings → Branches → main).
User is old but was paid anyway	A recorded payout always shows as paid, even for accounts outside the promo window — nothing to fix.

Frontend: the hub lives in `src/components/rewards-hub/`; rules in `src/hooks/useChallengeStatus.ts`; thresholds and the 24 Aug 2026 date in `src/appConstants.ts`. The two URLs above are configured as `VITE_REWARDS_PAYOUTS_URL` and `VITE_REWARDS_CLAIM_WEB_APP_URL`.
